

Tab. SM1 - List of 187 data points obtained from the 92 paternity analysis papers collected. For each data point are reported: the botanical group and family, the breeding system and the primary pollination vector of the studied species; the number of male and female individuals in the stand (in monoecious species the number of male individuals is equal to the number of female individuals), the number of pollen traps (referred to as “mother trees” in the text), the total number of sampled seeds, the stand area and stand density. In addition, for each paper the method and the molecular markers used for paternity assignment are reported. (NA): no information available.

Species	Group	Family	Breeding system ¹	Pollination vector	N males	N females	N traps	N seeds	Area	Density ²	Method ³	Markers ⁴	Reference
