

### Appendix 3 – Table Structural variables, kurtosis and correlations

Table S3.1. Structural variables considered in this work and selection criteria. Kurtosis values lower than 1 are reported in bold, as well as p-value indicating significant difference ( $p < 0.05$ ) between medians. W = Wilcoxon test (equivalent to Mann-Whitney). Source of complexity: VH = Vertical heterogeneity, CH = Composition heterogeneity, UA = Uneven-agedness, LLT = Occurrence of large living trees, GS = High growing stock, DW-TOT = Occurrence of a relatively high deadwood volume, DW-DC = Occurrence of deadwood in different decay classes, DW-ST = Occurrence of standing deadwood, dead trees and snags. Sampling efficiency: 1 – poor, 2 – medium, 3 – high. Core structural variables are highlighted.

Structural indicators	Kurtosis	Medians		W	p	Function as a surrogate (significant correlates with $\rho > 0.5$ )	Source of complexity	Sampling Efficiency (1, poor; 2, medium; 3, high)
		<100 ys.	> 100 ys.
